CAREER OBJECTIVE

Civil Engineering graduate with hands-on project experience in soil stabilization and geotechnical analysis. Seeking a Civil Engineer / Site Engineer role where I can apply my technical knowledge, analytical skills, and field experience to contribute to infrastructure development and deliver effective engineering solutions.

EDUCATION

Bachelor of Technology in Civil Engineering, <i>Mallareddy Institute of Technology and Science, Hyderabad</i> CGPA: 6.5	2019 – 2023 Hyderabad, India
Board of Intermediate, <i>Srichaitanya Junior College, Hyderabad</i> Percentage: 79%	2017 – 2019 Hyderabad, India
SSC, <i>Brilliant Grammar High School, Siddipet</i> Percentage: 80%	2016 – 2017 Siddipet

TECHNICAL SKILLS

Civil Engineering Skills

- Soil Stabilization
- Geotechnical Testing
- Mix Design
- Field Testing
- Construction Materials
- Surveying Basics

Software

- AutoCAD (basics)
- MS Excel
- MS Word

Programming (Additional Technical Skills)

- HTML
- CSS
- JavaScript
- React JS
- SQL
- Core Java

CIVIL ENGINEERING PROJECT

Experimental Investigation on Fly Ash Treated Black Cotton Soil with Lime as Additive,

Major Project - Civil Engineering

Objective: To improve the engineering properties of Black Cotton Soil using lime and fly ash to make it suitable for foundations, pavement subgrades, and road construction.

Problem Statement: Black Cotton Soil exhibits high shrink-swell behavior and low load-bearing capacity, making it unsuitable for direct construction use.

Methodology: - Used lime and fly ash as stabilizers in varying proportions (5%, 10%, 15%). - Conducted geotechnical tests such as: - Liquid Limit & Plastic Limit Tests - Standard Proctor Test (OMC & MDD) - Unconfined Compressive Strength (UCS) - Adopted mechanical and chemical stabilization techniques.

Key Results: - Significant reduction in soil plasticity. - Improved compaction characteristics (better OMC & MDD). - Increased UCS values demonstrating enhanced load-bearing capacity. - 10% Lime + 10% Fly Ash was identified as the optimum mix.

Outcome: This project demonstrated an economical and sustainable method for soil stabilization using industrial waste (fly ash), reducing dependency on cement.

DECLARATION

I hereby declare that the information provided above is true and correct to the best of my knowledge.
